Expressions, equations, and functions -- Properties of real numbers -- Solving linear equations -- Graphing linear equations and functions -- Writing linear equations -- Solving and graphing linear inequalities -- Systems of equations and inequalities -- Exponents and exponential functions -- Polynomials and factoring -- Quadratic equations and functions -- Radicals and geometry connections -- Rational equations and functions -- Probability and data analysis. Using a progressive but flexible format, this book contains a series of independent chapters that show how the principles and theory of real analysis can be applied in a variety of settings—in subjects ranging from Fourier series and polynomial approximation to discrete dynamical systems and nonlinear optimization. Users will be prepared for more intensive work in each topic through these applications and their accompanying exercises. Chapter topics under the abstract analysis heading include: the real numbers, series, the topology of \mathbb{R}^n , functions, normed vector spaces, differentiation and integration, and limits of functions. Applications cover approximation by polynomials, discrete dynamical systems, differential equations, Fourier series and physics, Fourier series and approximation, wavelets, and convexity and optimization. For math enthusiasts with a prior knowledge of both calculus and linear algebra. "The text is suitable for a typical introductory algebra course, and was developed to be used flexibly. While the breadth of topics may go beyond what an instructor would cover, the modular approach and the richness of content ensures that the book meets the needs of a variety of programs."--Page 1.
